

EnterpriseLIVE® SR

Building Secure and Robust Web-based Solutions

WEB SYSTEM TYPES

- High Assurance Intranet Platform
- Business Continuity Platform
- Online Transaction Assurance Platform
- Business Intelligence & Collaboration Platform
- C4ISR Access Assurance Platform (for defense applications)

EnterpriseLIVE® SR (Secure Router) is a flexible and scalable hardware network appliance that enables organizations to build robust, web-based solutions that are secured by Route1's MobiNET® identity management and service-delivery platform.

THE CONNECTIVITY CHALLENGE OF WEB SOLUTIONS

Connections between individuals and secure servers can leave both parties concerned about information security. Organizations want to ensure that their secure web solutions are only available to entitled individuals and individuals want to avoid the risk of identity theft caused by phishing and pharming attacks.

In 2006 it was reported that identity theft had a one-year cost of almost \$53 billion. More specifically, business victims experienced a total loss of \$47.5 billion or an average of \$4,800 per business victim per year. Individual victims account for a total loss of \$5 billion and \$500 per victim annually.

Americans spent 300 million hours resolving issues related to identity theft. Between individual and business identity theft victims, an average of 30 - 60 hours per victim was spent on handling various matters related to identity theft including new accounts, existing account and other frauds.

Organizations must protect their web solutions -

whether they are e-commerce websites or internal business intelligence portals - against the identity-based attacks that are prevalent on the Internet to ensure that their customers and employees are able to operate in a private and secure online environment.

PROVIDING SECURE WEB SOLUTIONS

EnterpriseLIVE SR is a hardware network appliance that seamlessly integrates into an organization's existing web architecture, allowing PurLINK® connections to be made directly to the organization's web system. EnterpriseLIVE SR provides organizations with control to secure their users or customers' transactions and provides IT administrators with the ability to manage and control user access into their web-based solution. EnterpriseLIVE SR secured content is accessible by any PurLINK-enabled device, such as Route1 MobiKEY®.

EnterpriseLIVE SR is Route1's family of high assurance platforms that integrates into any existing web portal architecture, public key infrastructure (PKI), and directory service. It has been optimized for rapid, seamless deployment, while providing the flexibility and scalability to grow with an organization's subscriber base.
