

MAP

MobiNET Administration and Provisioning Portal

WHY DEPOLY MAP?

- Manage and enforce IT security policies
- Support centralized or distributed management
- Enable user provisioning and monitoring
- Provide reporting facilities
- Enable auditing and audit controls for corporate and regulatory compliance
- Increase IT efficiencies

MAP is a web-based portal that provides IT administrators with centralized, organization-wide management of usage policies for subscribers of Route1's services such as TruOFFICE™ and PurLINK®, and products such as MobiVDI® and Route1 MobiKEY®. This simple-to-access provisioning tool also enables organizations to cost-effectively manage large-scale deployments of Route1's single-vendor products and services.

CHALLENGE WITH SOLUTION MANAGEMENT

Deploying a new solution across an organization can be a costly and time consuming endeavor. IT departments must ensure that the new solution adheres to their organization's security policies and that the new solution is scalable as the company grows and new users and devices are added. This process can be exacerbated when a solution relies on the products and services of multiple vendors.

MAP: ADMINISTRATION AND PROVISIONING

MAP's auditing controls enable IT administrators to easily manage the number of Route1 products and services subscriptions that are authorized to access network resources and ensure users adhere to policies designed to safeguard networks from unauthorized access.

The web-based portal provides enterprises with greater control over their employees' access to network applications and resources, making it simple and cost-effective to add and remove users, revoke certificates, conduct audits on usage, and modify subscriber rights and privileges.

A local registration authority (LRA) enables administrators to validate users and effectively control and manage the lifecycle of certificates, from selecting which users are assigned security certificates, to revoking them in the case of loss, theft or change in employee status.

INCREASED IT EFFICIENCY

MAP is ideal for large-scale enterprise deployments of 50 to thousands of Route1 products and service subscriptions, empowering organizations to use internal IT resources to manage the distribution and allocation of Route1 solutions.

IT administrators are required to use Route1's multi-factor authentication and client-side certificates, powered by MobiNET and delivered by MobiKEY, to access MAP to ensure IT administration remains a highly secure process.
